6.3 Trie

```
int trie[ms][sigma], terminal[ms], z;

void init() {
   memset(trie[0], -1, sizeof trie[0]);
   z = 1;
}

int get_id(char c) {
   return c - 'a';
}

void insert(string &p) {
   int cur = 0;
   for(int i = 0; i < p.size(); i++) {
      int id = get_id(p[i]);
      if(trie[cur][id] == -1) {
        memset(trie[z], -1, sizeof trie[z]);
      trie[cur][id] = z++;
   }</pre>
```

```
cur = trie[cur][id];
}
terminal[cur]++;
}
int count(string &p) {
  int cur = 0;
  for(int i = 0; i < p.size(); i++) {
    int id = get_id(p[i]);
    if(trie[cur][id] == -1) {
      return false;
    }
    cur = trie[cur][id];
}
return terminal[cur];
}</pre>
```

6.4 Aho-Corasick

```
int fail[ms];
queue<int> q;
void buildFailure() {
  q.push(0);
  while(!q.empty()) {
    int node = q.front();
    q.pop();
    for(int pos = 0; pos < sigma; pos++) {</pre>
      int &v = trie[node][pos];
      int f = node == 0 ? 0 : trie[fail[node]][pos];
      if(v == -1) {
        v = f;
      } else {
        fail[v] = f;
        q.push(v);
        // juntar as informacoes da borda para o V ja q um match em V
            implica um match na borda
        terminal[v] += terminal[f];
int search(string &txt) {
  int node = 0:
  int ans = 0;
  for(int i = 0; i < txt.length(); i++) {</pre>
    int pos = get_id(txt[i]);
    node = trie[node][pos];
    // processar informacoes no no atual
     ans += terminal[node];
  return ans;
```

// Construa a Trie do seu dicionario com o codigo acima

6.5 Algoritmo de Z

```
string s;
int fz[ms], n;

void zfunc() {
  fz[0] = n;
  for(int i = 1, l = 0, r = 0; i < n; i++) {
    fz[i] = max(0, min(r-i, fz[i-l]));
    while(s[fz[i]] == s[i+fz[i]]) ++fz[i];
    if(i + fz[i] > r) {
      l = i;
      r = i + fz[i];
    }
}
```

6.6 Suffix Array

```
namespace SA {
  typedef pair<int, int> ii;
  vector<int> buildSA(string s) {
    int n = (int) s.size();
    vector<int> ids(n), pos(n);
    vector<ii>> pairs(n);
    for (int i = 0; i < n; i++) {
     ids[i] = i;
      pairs[i] = ii(s[i], -1);
    sort(ids.begin(), ids.end(), [&](int a, int b) -> bool {

```

7 Miscellaneous

7.1 LIS - Longest Increasing Subsequence

```
int arr[ms], lisArr[ms], n;
// int bef[ms], pos[ms];

int lis() {
   int len = 1;
   lisArr[0] = arr[0];
   // bef[0] = -1;
   for(int i = 1; i < n; i++) {
        // upper_bound se non-decreasing</pre>
```

```
int x = lower_bound(lisArr, lisArr + len, arr[i]) - lisArr;
len = max(len, x + 1);
lisArr[x] = arr[i];
// pos[x] = i;
// bef[i] = x ? pos[x-1] : -1;
}
return len;
}

vi getLis() {
  int len = lis();
  vi ans;
  for(int i = pos[lisArr[len - 1]]; i >= 0; i = bef[i]) {
    ans.push_back(arr[i]);
  }
  reverse(ans.begin(), ans.end());
  return ans;
}
```

7.2 Ternary Search

```
for(int i = 0; i < LOG; i++) {</pre>
  long double m1 = (A * 2 + B) / 3.0;
  long double m2 = (A + 2 * B) / 3.0;
  if(f(m1) > f(m2))
   A = m1;
  else
    B = m2;
ans = f(A);
//Z
while (B - A > 4) {
  int m1 = (A + B) / 2;
  int m2 = (A + B) / 2 + 1;
  if(f(m1) > f(m2))
   A = m1;
  else
    B = m2:
ans = inf;
for (int i = A; i \le B; i++) ans = min(ans, f(i));
```

7.3 Count Sort

```
int H[(1<<15)+1], to[mx], b[mx];
void sort(int m, int a[]) {
   memset(H, 0, sizeof H);
   for (int i = 1; i <= m; i++) {
      H[a[i] % (1<<15)]++;
   }
   for (int i = 1; i < 1<<15; i++) {
      H[i] += H[i-1];
   }
   for (int i = m; i; i--) {
      to[i] = H[a[i] % (1 << 15)]--;</pre>
```

```
for (int i = 1; i <= m; i++) {
   b[to[i]] = a[i];
}
memset(H, 0, sizeof H);
for (int i = 1; i <= m; i++) {
   H[b[i]>>15]++;
}
for (int i = 1; i < 1<<15; i++) {
   H[i] += H[i-1];
}
for (int i = m; i; i--) {
   to[i] = H[b[i]>>15]--;
}
for (int i = 1; i <= m; i++) {
   a[to[i]] = b[i];
}</pre>
```

7.4 Random Number Generator

7.5 Rectangle Hash

```
namespace {
  struct safe_hash {
   static uint64_t splitmix64(uint64_t x) {
      // http://xorshift.di.unimi.it/splitmix64.c
      x += 0x9e3779b97f4a7c15;
     x = (x ^ (x >> 30)) * 0xbf58476d1ce4e5b9;
      x = (x ^ (x >> 27)) * 0x94d049bb133111eb;
      return x ^ (x >> 31);
   size_t operator()(uint64_t x) const {
      static const uint64_t FIXED_RANDOM = std::chrono::steady_clock::
          now().time_since_epoch().count();
      return splitmix64(x + FIXED_RANDOM);
 };
struct rect {
 int x1, y1, x2, y2; // x1 < x2, y1 < y2
  rect () {};
  rect (int x1, int y1, int x2, int y2) : x1(x1), x2(x2), y1(y1), y2(
      y2) {};
```

```
rect inter (rect other) {
   int x3 = max(x1, other.x1);
   int y3 = max(y1, other.y1);
   int x4 = min(x2, other.x2);
   int y4 = min(y2, other.y2);
   return rect(x3, y3, x4, y4);
}

uint64_t get_hash() {
   safe_hash sh;
   uint64_t ret = sh(x1);
   ret ^= sh(ret ^ y1);
   ret ^= sh(ret ^ x2);
   return ret;
}
```

7.6 Unordered Map Tricks

```
// pair<int, int> hash function
struct HASH{
    size_t operator() (const pair<int,int>&x) const{
        return (size_t) x.first * 37U + (size_t) x.second;
    }
};

unordered_map<int,int>mp;
mp.reserve(1024);
mp.max_load_factor(0.25);
```

7.7 Submask Enumeration

```
for (int s=m; ; s=(s-1)&m) {
    ... you can use s ...
    if (s==0) break;
}
```

7.8 Sum over Subsets DP

```
// F[i] = Sum of all A[j] where j is a submask of i
for(int i = 0; i<(1<<N); ++i)
  F[i] = A[i];
for(int i = 0; i < N; ++i) for(int mask = 0; mask < (1<<N); ++mask){
  if(mask & (1<<i))
    F[mask] += F[mask^(1<<i)];
}</pre>
```

7.9 Java Fast I/O

```
import java.io.OutputStream;
import java.io.IOException;
import java.io.InputStream;
```

```
import java.io.PrintWriter;
import java.util.Arrays;
import java.util.Random;
import java.io.IOException;
import java.io.InputStreamReader;
import java.util.StringTokenizer;
import java.io.BufferedReader;
import java.io.InputStream;
import java.util.*;
import java.io.*;
// src petr
public class Main {
  public static void main(String[] args) {
    InputStream inputStream = System.in;
   OutputStream outputStream = System.out;
    InputReader in = new InputReader(inputStream);

 y = 100 * (n - 49) + i + x;
// converts integer (Julian day number) to day of week
string intToDay (int jd) {
  return dayOfWeek[jd % 7];
```

7.11 Regular Expressions

```
import java.util.*;
import java.util.regex.*;

public class Main {
   public static String BuildRegex () {
      return "^" + sentence + "$";
   }

   public static void main (String args[]) {
      String regex = BuildRegex();
      // check pattern documentation
      Pattern pattern = Pattern.compile (regex);
      Scanner s = new Scanner(System.in);
      String sentence = s.nextLine().trim();
      boolean found = pattern.matcher(sentence).find()
   }
}
```

7.12 Lat Long

```
/*
Converts from rectangular coordinates to latitude/longitude and vice
versa. Uses degrees (not radians).
*/
struct ll
{
   double r, lat, lon;
```

```
struct rect
{
    double x, y, z;
};

ll convert(rect& P)
{
    ll Q;
    Q.r = sqrt(P.x*P.x*P.y*P.y*P.z*P.z);
    Q.lat = 180/M_PI*asin(P.z/Q.r);
    Q.lon = 180/M_PI*acos(P.x/sqrt(P.x*P.x*P.y*P.y));

    return Q;
}

rect convert(ll& Q)
{
    rect P;
    P.x = Q.r*cos(Q.lon*M_PI/180)*cos(Q.lat*M_PI/180);
    P.y = Q.r*sin(Q.lon*M_PI/180)*cos(Q.lat*M_PI/180);
    P.z = Q.r*sin(Q.lat*M_PI/180);
    return P;
}
```

8 Teoremas e formulas uteis

8.1 Grafos

```
Formula de Euler: V - E + F = 2 (para grafo planar)
Handshaking: Numero par de vertices tem grau impar
Kirchhoff's Theorem: Monta matriz onde Mi, i = Grau[i] e Mi, j = -1 se
    houver aresta i-j ou 0 caso contrario, remove uma linha e uma
    coluna qualquer e o numero de spanning trees nesse grafo eh o det
    da matriz
Grafo contem caminho hamiltoniano se:
Dirac's theorem: Se o grau de cada vertice for pelo menos n/2
Ore's theorem: Se a soma dos graus que cada par nao-adjacente de
    vertices for pelo menos n
Tem Catalan(N) Binary trees de N vertices
Tem Catalan (N-1) Arvores enraizadas com N vertices
Caley Formula: n^(n-2) arvores em N vertices com label
Prufer code: Cada etapa voce remove a folha com menor label e o label
    do vizinho eh adicionado ao codigo ate ter 2 vertices
Max Edge-disjoint paths: Max flow com arestas com peso 1
Max Node-disjoint paths: Faz a mesma coisa mas separa cada vertice em
    um com as arestas de chegadas e um com as arestas de saida e uma
    aresta de peso 1 conectando o vertice com aresta de chegada com
    ele mesmo com arestas de saida
Konig's Theorem: minimum node cover = maximum matching se o grafo for
    bipartido, complemento eh o maximum independent set
```

```
Min Node disjoint path cover: formar grafo bipartido de vertices duplicados, onde aresta sai do vertice tipo A e chega em tipo B, entao o path cover eh N - matching
```

Min General path cover: Mesma coisa mas colocando arestas de A pra B sempre que houver caminho de A pra B

Dilworth's Theorem: Min General Path cover = Max Antichain (set de vertices tal que nao existe caminho no grafo entre vertices desse set)

Hall's marriage: um grafo tem um matching completo do lado X se para cada subconjunto W de X,

Goldbach's: todo numero par n > 2 pode ser representado com n = a + b

 $|W| \leftarrow |vizinhosW|$ onde |W| eh quantos vertices tem em W

8.2 Math

onde a e b sao primos

```
Twin prime: existem infinitos pares p, p + 2 onde ambos sao primos
Legendre's: sempre tem um primo entre n^2 e (n+1)^2
Lagrange's: todo numero inteiro pode ser inscrito como a soma de 4
Zeckendorf's: todo numero pode ser representado pela soma de dois
    numeros de fibonnacis diferentes e nao consecutivos
Euclid's: toda tripla de pitagoras primitiva pode ser gerada com
    (n^2 - m^2, 2nm, n^2+m^2) onde n, m sao coprimos e um deles eh par
Wilson's: n \in P primo quando (n-1)! \mod n = n-1
Mcnugget: Para dois coprimos x, y o maior inteiro que nao pode ser
    escrito como ax + by eh (x-1)(y-1)/2
Fermat: Se p eh primo entao a^(p-1) % p = 1
Se x e m tambem forem coprimos entao x^k % m = x^k (k \mod (m-1)) % m
Euler's theorem: x^{(m)} \mod m = 1 onde phi(m) eh o totiente de
    euler
Chinese remainder theorem:
Para equacoes no formato x = a1 \mod m1, ..., x = an \mod mn onde todos
      os pares m1, ..., mn sao coprimos
Deixe Xk = m1 * m2 * ... * mn/mk e Xk^-1 mod mk = inverso de Xk mod mk, entao
x = \text{somatorio com } k \text{ de } 1 \text{ ate } n \text{ de } ak \times Xk \times (Xk, mk^-1 \text{ mod } mk)
Para achar outra solucao so somar m1*m2*..*mn a solucao existente
Catalan number: exemplo expressoes de parenteses bem formadas
C0 = 1, Cn = somatorio de <math>i=0 \rightarrow n-1 de Ci*C(n-1+1)
outra forma: Cn = (2n \text{ escolhe } n)/(n+1)
Bertrand's ballot theorem: p votos tipo A e q votos tipo B com p>q,
    prob de em todo ponto ter mais As do que Bs antes dele = (p-q)/(p+
Se puder empates entao prob = (p+1-q)/(p+1), para achar quantidade de
    possibilidades nos dois casos basta multiplicar por (p + q escolhe
Propriedades de Coeficientes Binomiais:
Somatorio de k = 0 \rightarrow m de (-1)^k \star (n \text{ escolhe } k) = (-1)^m \star (n -1)
    escolhe m)
(N \text{ escolhe } K) = (N \text{ escolhe } N-K)
(N \text{ escolhe } K) = N/K * (n-1 \text{ escolhe } k-1)
Somatorio de k = 0 \rightarrow n de (n \text{ escolhe } k) = 2^n
Somatorio de m = 0 \rightarrow n de (m = scolhe k) = (n+1 = scolhe k + 1)
Somatorio de k = 0 \rightarrow m de (n+k \text{ escolhe } k) = (n+m+1 \text{ escolhe } m)
Somatorio de k = 0 \rightarrow n de (n \text{ escolhe } k)^2 = (2n \text{ escolhe } n)
Somatorio de k = 0 ou 1 \rightarrow n de k*(n escolhe k) = n * 2^(n-1)
```

```
Somatorio de k = 0 \rightarrow n de (n-k \text{ escolhe } k) = \text{Fib}(n+1)
Hockey-stick: Somatorio de i = r \rightarrow n de (i escolhe r) = (n + 1)
Vandermonde: (m+n \ escolhe \ r) = somatorio \ de \ k = 0 -> r \ de \ (m \ escolhe \ k
    ) * (n escolhe r - k)
Burnside lemma: colares diferentes nao contando rotacoes quando m =
    cores e n = comprimento
(m^n + somatorio i = 1 - > n-1 de m^qcd(i, n))/n
Distribuicao uniforme a,a+1, ..., b Expected[X] = (a+b)/2
Distribuicao binomial com n tentativas de probabilidade p, X =
    sucessos:
    P(X = x) = p^x * (1-p)^(n-x) * (n escolhe x) e E[X] = p*n
Distribuicao geometrica onde continuamos ate ter sucesso, X =
    tentativas:
    P(X = x) = (1-p)^(x-1) * p e E[X] = 1/p
Linearity of expectation: Tendo duas variaveis X e Y e constantes a e
    b, o valor esperado de aX + bY = a*E[X] + b*E[X]
```

8.3 Geometry

```
pelo menos 2 orelhas, vertices que podem ser removidos sem criar um crossing, remover orelhas repetidamente triangula o poligono Incentro triangulo: (a(Xa, Ya) + b(Xb, Yb) + c(Xc, Yc))/(a+b+c) onde a = lado oposto ao vertice a, incentro eh onde cruzam as bissetrizes, eh o centro da circunferencia inscrita e eh equidistante aos lados
```

Delaunay Triangulation: Triangulacao onde nenhum ponto esta dentro de nenhum circulo circunscrito nos triangulos

Eh uma triangulacao que maximiza o menor angulo e a MST euclidiana de um conjunto de pontos eh um subconjunto da triangulacao

```
Brahmagupta s formula: Area cyclic quadrilateral s = (a+b+c+d)/2 area = sqrt((s-a)*(s-b)*(s-c)*(s-d)) d = 0 => area = sqrt((s-a)*(s-b)*(s-c)*s)
```

8.4 Mersenne's Primes

```
Primos de Mersenne 2^n - 1
Lista de Ns que resultam nos primeiros 41 primos de Mersenne:
2; 3; 5; 7; 13; 17; 19; 31; 61; 89; 107; 127; 521; 607; 1.279; 2.203;
2.281; 3.217; 4.253; 4.423; 9.689; 9.941; 11.213; 19.937; 21.701;
23.209; 44.497; 86.243; 110.503; 132.049; 216.091; 756.839;
859.433; 1.257.787; 1.398.269; 2.976.221; 3.021.377; 6.972.593;
13.466.917; 20.996.011; 24.036.583;
